- Stock price: The closing price on NSE as on the date of grant has been considered for valuing the options granted.
- Expected Volatility: The daily volatility of the stock prices on NSE till the date of grant corresponding with the expected life of the options has been considered to calculate the fair value of the options.
- Risk free interest rate: The risk free interest rate on the date of grant considered for the calculation is the interest rate applicable for a maturity equal to the expected life of the options based on the zero coupon yield curve for Government Securities.
- Time of Maturity/ Expected Life: Time of Maturity/
  Expected Life of option is the period for which the
  Company expects the option to be live. The minimum life
  of a stock option is the minimum period before which the
  options cannot be exercised and the maximum life is the
  period after which the options cannot be exercised.
- Expected dividend yield: Expected dividend yield has been calculated on the dividend prior to the date of the grant.

#### b) Assumptions under Monte Carlo Simulation model

Vesting of options is dependent on the shareholder return during the performance period as compared to comparator group identified by Nomination and Remuneration Committee. The Monte Carlo model requires the following variables of the company and comparator group companies.

- Historical share price and expected volatility during the performance period
- Risk free interest rate of the country where stock of comparator group is listed
- · Dividend yield based on historical dividend payments
- Estimate of correlation coefficients for each pair of company
